

**ADMINISTRATIVE WASTE IN THE U.S.
HEALTH CARE SYSTEM IN 2003: THE COST TO
THE NATION, THE STATES, AND THE DISTRICT
OF COLUMBIA, WITH STATE-SPECIFIC ESTIMATES
OF POTENTIAL SAVINGS**

David U. Himmelstein, Steffie Woolhandler,
and Sidney M. Wolfe

This report provides nationwide and state-specific estimates of U.S. health care administration spending and potential savings in 2003 were the United States to institute a Canadian-style national health insurance system. The United States wastes more on health care bureaucracy than it would cost to provide health care to all its uninsured. Administrative expenses will consume at least \$399.4 billion of a total health expenditure of \$1,660.5 billion in 2003. Streamlining administrative overhead to Canadian levels would save approximately \$286.0 billion in 2003, \$6,940 for each of the 41.2 million Americans who were uninsured as of 2001. This is substantially more than would be needed to provide full insurance coverage. The cost of excess health bureaucracy in individual states is equally striking. For example, Massachusetts, with 560,000 uninsured state residents, could save about \$8,556 million in 2003 (\$16,453 per uninsured resident of that state) if it streamlined administration to Canadian levels. New Mexico, with 373,000 uninsured, could save \$1,500 million on health bureaucracy (\$4,022 per uninsured resident). Only a single-payer national health insurance system could garner these massive administrative savings, allowing universal coverage without any increase in total health spending. Because incremental reforms necessarily preserve the current fragmented and duplicative payment structure, they cannot achieve significant bureaucratic savings.

In this article we compare the cost of health care bureaucracy in the United States with that in Canada in 2003. We also calculate the cost of excess bureaucracy in each of the 50 states and the District of Columbia. These state-by-state estimates

International Journal of Health Services, Volume 34, Number 1, Pages 79–86, 2004

© 2004, Baywood Publishing Co., Inc.

represent the amount spent on administration and the potential savings through the implementation of a single-payer, universal health care program similar to Canada's. This information should be useful to consumers, national and state legislators, health policy experts, economists, and others concerned with skyrocketing medical costs and declining access to medical care.

METHODS

We added six components of administrative expense—insurance overhead, employers' costs to administer health benefits, hospital administration, nursing home administration, practitioners' overhead, and home care agency administration—to calculate total administrative spending by state in 2003. We estimated each state's 2003 spending by category of expenditure (hospitals, physicians, etc.) by adjusting 1998 state-by-state expenditure data from the Office of the Actuary, National Center for Health Statistics (the most recent state-by-state health spending data available). This adjustment was carried out under the assumption that for each state, increases in health care costs since 1998 mirror those of the nation as a whole. We estimated nationwide changes in health expenditures since 1998 by using figures from the Office of the Actuary, National Center for Health Statistics.

Administrative spending on each component was then calculated by multiplying 2003 projected state spending for each of the six categories by the percentage of spending in each category devoted to administration in 1999. We assumed that administration would consume the same percentage of each type of spending in each state in 2003 as it did in the nation in 1999: 100 percent of insurance overhead and employers' costs to administer health benefits; 24.3 percent of expenditures for hospital care; 19.2 percent of expenditures for nursing home care; 35.0 percent of home care expenditures; and 26.9 percent of spending on physicians' services. (For further details on the 1999 estimates of administrative spending in each category, see the accompanying article by Woolhandler, Campbell, and Himmelstein on p. 65 of this Journal issue.) This is a conservative assumption, given that administration's share has probably continued to grow since 1999.

Our figures for administrative costs exclude spending in health sectors for which no administrative cost data were available (e.g., retail pharmacies, ambulance companies, and medical equipment suppliers). Hence, our dollar estimates understate total administrative costs in each state and in the nation.

For our estimate of total potential administrative savings we summed potential savings on each of the six administrative components. Each state's saving on each component was calculated as the product of 2003 projected state spending in each of the six categories and the ratio between per capita spending for that administrative component in Canada and the United States in 1999. For instance, in 1999 Canada spent \$47 per capita on health insurance overhead,

while the United States spent \$259. We assumed that this ratio (47:259) remained the same as both nations' health spending increased between 1999 and 2003—that is, that Canadian administrative costs rose at the same rate as U.S. administrative costs.

RESULTS

Administrative Costs 1969–1999

The administrative structure of the U.S. health care system consumes a large share of health spending. In 1999, administrative spending consumed at least 31.0 percent of health spending (see the accompanying article by Woolhandler, Campbell, and Himmelstein). In contrast, administrative costs in Canada, which has had a national health program since 1971, are about 16.7 percent of health spending. In 1969 administrative personnel accounted for 18.2 percent of the health care workforce in the United States. By 1999 administration's share had risen to 27.3 percent of total employees—a 50 percent increase. This figure excludes the 926,000 employees in life/health insurance firms and 724,000 employed in insurance brokerages. Overall, at least 31.0 percent of health spending was devoted to administration in the United States in 1999.

In contrast, administration's share of health employment in Canada (where a national health program has been in place since 1971) grew only 17 percent between 1971 and 1986, and has remained virtually unchanged since 1986. In 1996 administrative workers accounted for 19.1 percent of health employees, versus 27.3 percent in the late 1990s in the United States (both of these figures exclude health insurance company workers, who are far more numerous in the United States). Administration consumed 16.7 percent of Canadian health spending in 1999.

Nationwide Administrative Costs in 2003

In 2003, bureaucracy will consume at least \$399.4 billion (\$1,389 per capita) of a total health expenditure of \$1,660.5 billion (\$5,775 per capita). This estimate is based on the conservative assumption that, in 2003, administrative overhead represents the same share of health spending on hospital care, nursing home care, physicians' services, home care, employers' costs to administer health benefits, and insurance overhead as in 1999 (i.e., that administrative costs have not continued to rise). It excludes the administrative costs of health sectors for which administrative cost data were unavailable (e.g., drug stores, ambulance companies, and medical equipment suppliers). Streamlining administration to Canadian levels would save \$286.0 billion in administrative costs in 2003, \$982 per capita (see Methods for details of calculations).

^aU.S. figure is for total health expenditures; state figures are for personal health expenditures, which exclude a few expense categories such as research and construction. The 2003 state estimates were calculated from 1998 state-specific health spending adjusted for the national rate of health expenditure growth between 1998 and 2003 and for changes in state population.

^bAdministrative spending was calculated by multiplying 2003 state (or, for the United States, national) spending in each of the six categories—insurance overhead, employers' costs to administer health benefits, hospitals, nursing homes, practitioners' offices, and home care agencies—by the percentage of spending in each area devoted to administration in 1999.

^cPotential administrative savings were calculated for each of the six categories by subtracting estimated per capita costs for that category in Canada from per capita cost for that category in the state (or in the United States as a whole), and multiplying by the state's (or U.S.) population. The potential administrative savings in the six categories were then summed.

^dEstimates of the number of uninsured residents in each state are from the March 2002 Current Population Survey. Although CPS uses a nationally representative survey, it may not provide precise estimates for smaller states.

^eCalculated by dividing potential administrative savings in 2003 by the number of uninsured state residents as of 2001.

^fState figures may not sum to national totals, because of rounding error and the exclusion of nonresident military personnel.

Administrative Waste: The Cost to the States

If the states were as efficient at administering health care as are the Canadian provinces, they would save more than enough to fund universal coverage, without any increase in total health spending. Table 1 shows estimated spending for health administration in each state (grouped, for the most part, by region of the country) in 2003, as well as a minimum estimate of potential administrative savings under a single-payer system. The table also shows the number of uninsured in 2001 (the latest data available) and the administrative savings available per uninsured resident.

California has the largest state health budget; personal health spending is estimated at about \$163 billion in 2003. That state would save at least \$33,699 million on health bureaucracy by instituting a single-payer reform, \$5,016 for each of the 6.7 million Californians who are uninsured. At the other end of the scale in terms of population, Wyoming, with an estimated 78,000 residents without health insurance, would save at least \$376 million in 2003, \$4,814 per uninsured resident of that state. The available administrative savings per uninsured resident vary widely—from \$3,925 per uninsured resident in Texas to \$17,771 in the District of Columbia. The variation reflects differences in uninsurance rates (with Texas having a very high percentage of residents uninsured) and (to a lesser extent) differences in per capita health administration costs. Despite the range, in every state the potential savings on administration would be sufficient to cover the uninsured.

Our estimates are based solely on administrative savings, only one part of the potential savings under a Canadian-style national health insurance system. The Canadian single-payer health system is also better at controlling systemwide inflation. Health expenditures in the United States are currently rising three times as rapidly as the U.S. gross national product; in Canada they are rising at a rate only slightly greater than growth in the GNP. Since we do not include the savings that national health insurance would generate by controlling nonadministrative health inflation, our estimates represent a lower bound of what could be achieved with a single-payer national health program.

CONCLUSION

In 2003 the United States will spend \$399.4 billion (\$1,389 per capita) on health bureaucracy, of a total health expenditure of \$1660.5 billion (\$5,775 per capita). The states could save \$286.0 billion in 2003 if they streamlined administration to Canadian levels by adopting a single-payer national health insurance system. The potential savings are equivalent to at least \$6,940 for each of the 41.6 million Americans uninsured in 2001.

These potential administrative savings are far higher than recent estimates of the cost of covering the uninsured in the United States. For instance, researchers

from the Urban Institute estimate that covering all the uninsured with an “average” private insurance policy would cost \$69 billion annually (1). Thus the \$286.0 billion in administrative savings could cover every uninsured person, with \$217 billion left over to upgrade coverage for those who are currently underinsured—for example, to offer first-dollar drug coverage to seniors.
